Introduction

This document includes the results of the security audit for Seven Seas's smart contract code as found in the section titled 'Source Code'.

The purpose of this audit is to review the source code of certain Seven Seas Solidity contracts, and provide feedback on the design, architecture, and quality of the source code with an emphasis on validating the correctness and security of the software in its entirety.

Disclaimer: While Macro's review is comprehensive and has surfaced some changes that should be made to the source code, this audit should not solely be relied upon for security, as no single audit is guaranteed to catch all possible bugs.

Overall Assessment

The following is an aggregation of issues found by the Macro Audit team:

Severity	Count	Acknowledged	Won't Do	Addressed
Low	1	-	-	1
Informational	1	-	-	-

Seven Seas was quick to respond to these issues.

Specification

Our understanding of the specification was based on the following sources:
The security audit was performed by the Macro security team on May 22nd 2024.

Trust Model, Assumptions, and Accepted Risks (TMAAR)

Trust Assumptions:

In addition to the trust assumptions mentioned in [SevenSeas-4](#), and [SevenSeas-5](#), this update allows addresses to be blacklisted from interacting with boringVault shares. Users must trust that addresses with the role authorized to update the blacklist will do so in the interest of the protocol and not freeze users assets without good reason.

Source Code

The following source code was reviewed during the audit:

- **Repository:** [boring-vault](#)
- **Commit Hash:** `9c6e1e4458fba53f2ff09efe21195dcf570ffc3e`

Specifically, we audited the following contracts within this repository, and reviewed the migration steps to move assets from the Liquid cellar to a Liquid boring vault.

Source Code	SHA256
<code>src/base/BoringVault.sol</code>	<code>38253e3f0fb66c856d8293e7ea7b709e7cd05035c208077979c62e7e8d98e24d</code>
<code>src/base/Roles/TellerWithMultiAssetSupport.sol</code>	<code>c1e9fecdcab6a7896df2f79f1b4b100bb8c9a2849b7a94e673a9279492ae1254</code>
<code>src/base/DecodersAndSanitizers/Protocols/EthenaWithdrawDecoderAndSanitizer.sol</code>	<code>154e4924894c1e63f65ca1e30de5138561a77990b48c491b802974c0b84966da</code>
<code>src/migration/CellarMigrationAdaptor.sol</code>	<code>5c774f8963326fbfe202cbeba092d2bbed97f263d18283ba574673186773d854</code>
<code>src/migration/CellarMigrationAdaptor2.sol</code>	<code>110e76323040580e4e354e8b1f7206acb5c53fa03952022d355e855c0f4a8f56</code>
<code>src/migration/CellarMigratorWithSharePriceParity.sol</code>	<code>cd3021756928dcc1c71819271c7ce077e24c0254b04f2ff55bc1641d22da573d</code>
<code>src/migration/ParitySharePriceOracle.sol</code>	<code>69d84b13fd18883758c5f54cec4f50aad8e6b555435d814dc64e5b54bd24d5a4</code>

Note: This document contains an audit solely of the Solidity contracts listed above. Specifically, the audit pertains only to the contracts themselves, and does not pertain to any other programs or scripts, including deployment scripts.

Issue Descriptions and Recommendations

Click on an issue to jump to it, or scroll down to see them all.

Contracts facilitating transfers may want to be blocked as well

Addresses can be blacklisted from interacting with boringVault shares

Security Level Reference

We quantify issues in three parts:

1. The high/medium/low/spec-breaking **impact** of the issue:

- How bad things can get (for a vulnerability)
- The significance of an improvement (for a code quality issue)
- The amount of gas saved (for a gas optimization)

2. The high/medium/low **likelihood** of the issue:

- How likely is the issue to occur (for a vulnerability)

3. The overall critical/high/medium/low **severity** of the issue.

This third part – the severity level – is a summary of how much consideration the client should give to fixing the issue. We assign severity according to the table of guidelines below:

Severity	Description
(C-x) Critical	We recommend the client must fix the issue, no matter what, because not fixing would mean significant funds/assets WILL be lost.
(H-x) High	We recommend the client must address the issue, no matter what, because not fixing would be very bad, or some funds/assets will be lost, or the code's behavior is against the provided spec.
(M-x) Medium	We recommend the client to seriously consider fixing the issue, as the implications of not fixing the issue are severe enough to impact the project significantly, albeit not in an existential manner.
(L-x) Low	The risk is small, unlikely, or may not be relevant to the project in a meaningful way. Whether or not the project wants to develop a fix is up to the goals and needs of the project.
(Q-x) Code Quality	The issue identified does not pose any obvious risk, but fixing could improve overall code quality, on-chain composability, developer ergonomics, or even certain aspects of protocol design.
(I-x) Informational	Warnings and things to keep in mind when operating the protocol. No immediate action required.
(G-x) Gas Optimizations	The presented optimization suggestion would save an amount of gas significant enough, in our opinion, to be worth the development cost of implementing it.

Issue Details

 Contracts facilitating transfers may want to be blocked as well

TOPIC	STATUS	IMPACT	LIKELIHOOD
Use Cases	Fixed 	Medium	Low

With the addition of a blacklist to boring vaults, currently only the sender and receiver of the shares are passed to the teller in `beforeTransfer()` to check if they are blacklisted:

```
/**
 * @notice Implement beforeTransfer hook to check if shares are locked, or if `
 */
function beforeTransfer(address from, address to) external view {
    if (denyList[from] || denyList[to]) revert TellerWithMultiAssetSupport__Tra
        if (shareUnlockTime[from] >= block.timestamp) revert TellerWithMultiAss
}
```

Reference: [TellerWithMultiAssetSupport.sol#L210-L216](#)

However, when shares are transferred via `transferFrom()`, an approved operator facilitates the transfer, but in doing so this could be a contract that is involved in illegal or malicious behaviour that may want to be blocked. This may be unlikely but if contracts can be sanctioned as tornado cash was, in order to remain compliant with current or future regulations, it may be wise to allow for the ability to block operators in case it becomes necessary.

I-1

Addresses can be blacklisted from interacting with boringVault shares

TOPIC

Informational

IMPACT

Informational *

There is now the ability for an authorized role to update a **denyList** which prevents any address on the list from sending, receiving, or facilitating the transfer of vault shares. Although this is an accepted practice, and widely used tokens like USDC also have blacklist functionality, users should be aware that they can have their shares frozen. Blacklisting addresses should typically only be done to freeze assets of malicious users or prevent interaction with undesired contracts. Developers should also be aware that for contracts interacting with these shares, that either users or the contract itself can be blacklisted, which may adversely effect the contracts functionality.

Disclaimer

Macro makes no warranties, either express, implied, statutory, or otherwise, with respect to the services or deliverables provided in this report, and Macro specifically disclaims all implied warranties of merchantability, fitness for a particular purpose, noninfringement and those arising from a course of dealing, usage or trade with respect thereto, and all such warranties are hereby excluded to the fullest extent permitted by law.
